DEPARTMENT OF MATHEMATICS and COMPUTER SCIENCE

CSI 30 Sample Test 1

Present all your work in order to get full credit.
Show solutions when asked, do not give answers only.

1. Determine whether each of the following sentences is a proposition or not. If the sentence is a proposition, then write its negation.

   a) It is raining outside.

   b) What time is it now?

2. Construct a truth table for the compound proposition $(\neg p \vee q) \wedge (\neg r \rightarrow q)$

3. Show that the conditional statement $\neg p \rightarrow (p \rightarrow q)$ is a tautology by using truth tables

4. Show that the compound proposition $\neg(p \rightarrow q) \rightarrow \neg q$ is a tautology without using truth tables.

5. Show that the following compound propositions are equivalent using laws.

   $p \leftrightarrow q$ and $(p \wedge q) \vee (\neg p \wedge \neg q)$

6. Let p, q, and r be the propositions:

   p: "Grizzly bears have been seen in the area."

   q: "Hiking is safe on the trail."

   r: "Berries are ripe along the trail."

   Write compound propositions using p,q, and r and logical connectives $\vee$, $\wedge$, $\neg$, $\rightarrow$, and $\leftrightarrow$.

   a) Berries are ripe along the trail, but grizzly bears have not been seen in the area.

   b) Hiking is safe on the trail if and only if berries are not ripe along the trail or the grizzly bears have not been seen in the area.

   c) If berries are ripe along the trail then hiking along the trail is not safe.

7. Determine the truth value of each of these statements if the domain of each variable consists of all integers. Provide explanation for your answer.

   a) $\forall x \exists y (xy \geq 0)$

   b) $\exists! x (5x - 1 = 2x + 4)$

8. Use quantifiers and logical connectives to translate English statements into logical expressions. The domain of discourse is all people.

   a) No one is perfect.

   b) Not everyone is perfect.

   c) At least one of your friends is perfect.

9. Write the negation of each of the following logical expressions so that all negations immediately precede predicates. In some cases, it may be necessary to apply one or more laws of propositional logic.

   $\forall x \exists y \forall z ((\neg P(x, y) \land Q(x, z)) \to \neg T(y))$

10. Prove that the argument is valid by replacing each proposition with a variable to obtain the form of the argument. Then use the rules of inference and laws, if necessary, to prove that the form is valid.

    " If I work all night on this homework, then I can answer all the exercises. If I answer all the exercises, I will understand the material. Therefore, if I work all night on this homework, then I will understand the material"''
